

We know you're relying on us...

That's why Orange & Rockland invested over \$130 million this past year to fortify and enhance the reliability of our electric system. These improvements further strengthen the infrastructure during summer and winter peak demands.

Service Reliability Projects

Here are just two examples of our latest energy projects that will help make service safer, more reliable and resilient.

- **Ramapo Substation Transformer Bank Replacements – Ramapo, NY:** We replaced six single phase 345kV/138kV transformer banks at the Ramapo Substation, which significantly improves the efficient and reliable operation of O&R's electric transmission system.
- **Transmission Line 47 – Old Tappan, Norwood and Closter, NJ:** This two-year project involved the installation of 3.2 miles of underground electric transmission line from Old Tappan through Norwood to Closter, making this one of the single largest resilience and reliability improvement projects in our history.
