

Labeling Electricity: It's the Law

The State of New Jersey requires all electricity suppliers to provide standardized environmental information so you'll know the resources used to generate electricity (coal, natural gas, hydroelectric, nuclear, solar or other renewable source) and the air emissions associated with the method of generating electricity and how it compares to the statewide benchmark. In accordance with the law, Rockland Electric is providing you with the following environmental data, based on the most recently available fuel and emissions information, which is for the period January 2015 through June 2015. Rockland Electric updates and distributes this information twice a year.

If you purchase electricity from a supplier other than Rockland Electric, that supplier is required to provide you with standardized environmental information.

Energy Sources

Electricity can be generated in a number of ways with different impacts on the environment. The standardized environmental information shown allows you to compare this electricity product with electricity products offered by other electric suppliers.

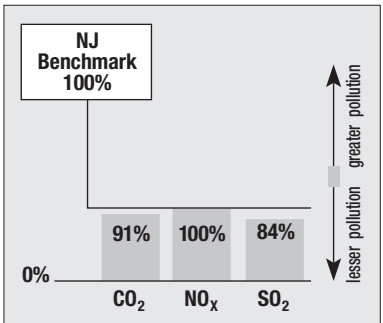

Coal	32.4%
Nuclear	34.6%
Natural Gas	24.8%
Oil	.3%
Renewable energy	
Hydroelectric	4.3%
Wind	2.3%
Solid Waste	0.6%
BioMass	0.6%
Solar	0.2%
Total	100%*

Rockland Electric relied on these energy resources to provide the electricity product.

**Actual total may vary slightly from 100% due to rounding.*

Air Emissions

The amount of air pollution associated with the generation of the electricity product is shown. This amount is compared to a New Jersey benchmark. The benchmark approximates the average emission rate for all electricity generation in New Jersey.

CO₂ is a “greenhouse” gas which may contribute to global climate change. SO₂ and NO_x react to form acids found in acid rain. NO_x also reacts to form ground level ozone, an unhealthy component of “smog.”
